1 Full Dimensional Model Statement

1.1 Data Model

$$\mathbf{y}_t = \mathbf{H}_t \mathbf{X} \boldsymbol{\beta}_t + \boldsymbol{\eta}_t + \boldsymbol{\epsilon}_t$$

1.2 Process Model

$$\begin{aligned} \boldsymbol{\beta}_t &\sim N(\boldsymbol{\mu}_\beta, \boldsymbol{\Sigma}_\beta) & \boldsymbol{\Sigma}_\beta &= \sigma_\beta^2 \mathbf{I}_t \\ \boldsymbol{\eta}_t &\sim N(0, \boldsymbol{\Sigma}_\eta) & \boldsymbol{\Sigma}_\eta &= \sigma_\eta^2 \mathbf{R}(\phi) & \mathbf{R}(\phi) &= \exp(-\mathbf{D}_t/\phi) \\ \boldsymbol{\epsilon}_t &\sim N(0, \boldsymbol{\Sigma}_\epsilon) & \boldsymbol{\Sigma}_\epsilon &= \sigma_\epsilon^2 \mathbf{I}_t \end{aligned}$$

1.3 Parameter Model

$$\begin{aligned} \boldsymbol{\mu}_\beta &\sim N(\boldsymbol{\mu}_0, \boldsymbol{\Sigma}_0) \\ \sigma_\beta^2 &\sim IG(\alpha_\beta, \beta_\beta) \\ \sigma_\eta^2 &\sim IG(\alpha_\eta, \beta_\eta) \\ \sigma_\epsilon^2 &\sim IG(\alpha_\epsilon, \beta_\epsilon) \\ \phi &\sim IG(\alpha_\phi, \beta_\phi) \end{aligned}$$

where \mathbf{I}_β is the identity matrix of size $\tau \times \tau$ where τ is the number of parameters in $\boldsymbol{\beta}_t$, \mathbf{I}_t is the identity matrix of size $n_t \times n_t$ and n_t is the number of samples of y_t at time t and \mathbf{D}_t is the distance matrix between locations observed at time t . Define $\boldsymbol{\Sigma} = \boldsymbol{\Sigma}_\eta + \boldsymbol{\Sigma}_\epsilon$

2 Predictive Process

For large dimensional spatial processes it can be computationally expensive to invert $\boldsymbol{\Sigma}$. This motivates the use of a predictive process $\tilde{\boldsymbol{\eta}}$ to approximate $\boldsymbol{\eta}$ over a set of knots \tilde{S} where $\tilde{\boldsymbol{\eta}} = \mathbf{r}(\mathbf{s}, \mathbf{s}^* | \sigma_\eta^2, \phi)^T \mathbf{R}^{*-1}(\mathbf{s}^*, \mathbf{s}^* | \sigma_\eta^2, \phi) \boldsymbol{\eta}^*$. The covariance between the desired locations $\mathbf{s} \in S$ and the set of knots $\mathbf{s}^* \in \tilde{S}$ is $\mathbf{r}(\mathbf{s}, \mathbf{s}^* | \sigma_\eta^2, \phi)$. The covariance matrix over the set of knots is $\mathbf{R}^{*-1}(\mathbf{s}^*, \mathbf{s}^* | \sigma_\eta^2, \phi)$. The lower dimensional $\boldsymbol{\eta}^* \sim \text{MVN}(\mathbf{0}, \mathbf{R}^{*-1}(\mathbf{s}^*, \mathbf{s}^* | \sigma_\eta^2, \phi))$.

3 Posterior

$$\prod_{t=1}^T [\boldsymbol{\beta}_t, \boldsymbol{\mu}_\beta, \sigma_\beta^2, \sigma_\eta^2, \sigma_\epsilon^2, \phi | \mathbf{y}_t] \propto \prod_{t=1}^T [\mathbf{y}_t | \boldsymbol{\beta}_t, \sigma_\eta^2, \phi, \sigma_\epsilon^2] [\boldsymbol{\beta}_t | \boldsymbol{\mu}_\beta, \sigma_\beta^2] [\boldsymbol{\mu}_\beta] [\sigma_\beta^2] [\sigma_\eta^2] [\sigma_\epsilon^2] [\phi]$$
